Ok its Story time …. First time learning to Deploy a site and lab objective was to create a landing page of sort to deploy on to heroku . So im googling all frantically trying to come up with ideas and examples to create an eye catching landing page ;first off let me say everything i do is all was intended to be XL no good but great. Now back to the story ..lol.. So i ended up attempting to create an mock-site of somewhat for an restaurant . The restaurant intended was PAPPADEUX as you may have guest it was just too generic for me from my stand point that is. After i crafted and coded for a few hours i just wasnt satisfied but still brought it to the table ; during end of day discussion i noticed a few of the students ended up going with games . Then all of a sudden my tunnel vision cleared and i realized i had 4 or 5 sticky notes for ideas, app,sites and an epiphany occurred . i then when home worked aimlessly on the first project of many more to come using the constantly growing knowledge im obtaining and my brilliance came up with an word find game called GETTISM. It dawned on my that my obscure way of thinking can change the world in so many shapes forms and fashions.(Gettism)<------check it out

Before fully pursuing my career as an full-stack dev i took the initiative to enroll in a foundations course before the foundations course. There i was bombarded with so many terms and analogies for code and at first it took me by storm. Week by week i was intrigued by everything i was learning i went from hearing anchor tag, html, cascade style sheet , to week 4 building a interactive shopping site . Even though it was basic on the functionality the graphics were so amazing to me just the thought of comparing were i started to were i was at that moment . That moment i finished my project that took me 3 strenuous days to make i said to myself i could do this for the rest of my life .(https://codepen.io/GeTtyGreen/details/eYGzRGe)<----check it out

My biggest challenge so far that is ….. Has been to create a working, hosted , functional and styled app. Again there i was googling frantically ,then i stopped and went to my sticky notes and found an idea i had wrote down in my first week of class. I failed to mention that every time an app idea erupts i write in on a sticky note or in my phone to not forget and end up overlooking it ;not this time . I then gave birth to ItsUpThere.info ; which is an social media group trip booking site . At first i did not get any sleep, trying to link data bases and working with my first API. Four days in was hell , i mean my styling was there as always but the api and database just would not link with the backend. Finally, within the last few days with the help of my instructors and some sleep and nourishment i may add . I opened my laptop to realize a few words misspelled and misdirected paths is what had me at an stand still . Now even though its still in the development stage this app is projected to go viral .(www.itsupthere.info)<-----------check it out
